

TECHNICAL SHOWCASE

Lean TECHniques

Photo Album Showcase

Create either a console or a UI application that displays photo ids and titles in an album.

The photos are available in this web service: <https://jsonplaceholder.typicode.com/photos>. Photos are filtered with a query string. This will return photos within Album ID 3

<https://jsonplaceholder.typicode.com/photos?albumId=3>.

- You can use any language or framework.
- You can use any open source libraries.
- Automated tests are encouraged.
- Post your solution on a free repository such as GitHub and send us a link.
- Provide a README that contains instructions on how to build and run your application.
- Spend as much (or little) time as you'd like on this.
- Feel free to use any resources available.

For a Console application, an example input and output could look like this (but feel free to get more creative):
photo-album 2

[53] soluta et harum aliquid officiis ab omnis consequatur

[54] ut ex quibusdam dolore mollitia

For a UI application, you could have an optional Album ID input and display the results (but feel free to get more creative).
